### PROGRAMMING 1(ISPRGG1)

The screenshot displays a C# code editor with the file name 'GuessTheNumber' and the class 'GuessTheNumber.Form1'. The code implements a simple number guessing game. It defines a namespace 'GuessTheNumber' and a partial class 'Form1' which inherits from 'Form'. The class contains three methods: a constructor 'Form1()' that calls 'InitializeComponent()', a 'TextChanged' event handler for 'textBox1' that does nothing, and a 'Click' event handler for 'btnGuess' that implements the game logic. The logic sets a secret number to 44, converts the user's input from 'txtGuess.Text' to an integer, and enters a 'while' loop that continues until the guess equals the secret. If the guess is wrong, it updates 'lblStatus.Text' to 'Wrong Guess! Try Again.' and returns. If the guess is correct, it sets 'lblStatus.Text' to 'You Win!'.

```
1 namespace GuessTheNumber
2 {
3     3 references
4     public partial class Form1 : Form
5     {
6         1 reference
7         public Form1()
8         {
9             InitializeComponent();
10
11         1 reference
12         private void textBox1_TextChanged(object sender, EventArgs e)
13         {
14
15         1 reference
16         private void btnGuess_Click(object sender, EventArgs e)
17         {
18             int secret = 44;
19             int guess = Convert.ToInt32(txtGuess.Text);
20
21             while (guess != secret)
22             {
23                 lblStatus.Text = "Wrong Guess! Try Again.";
24                 return;
25             }
26             lblStatus.Text = "You Win!";
27         }
28     }
29 }
```

Below the code editor, two instances of the 'Form1' application window are shown side-by-side. The left window shows the initial state with the input field containing '4' and the status label displaying 'Wrong Guess! Try Again.' The right window shows the state after a correct guess, with the input field containing '44' and the status label displaying 'You Win!'.

#### 4. Coin Collector

**De La Salle – College of Saint Benilde**

<https://www.benilde.edu.ph/antipolo>

## PROGRAMMING 1(ISPRGG1)

The image shows a C# code editor window titled 'CoinCollect' and a Windows Form application titled 'COIN COLLECTOR'.

**Code Editor (CoinCollect.cs):**

```
1 namespace CoinCollect
2 {
3     3 references
4     public partial class Form1 : Form
5     {
6         1 reference
7         public Form1()
8         {
9             InitializeComponent();
10
11         1 reference
12         private void btnCollect_Click(object sender, EventArgs e)
13         {
14             int coins = 0;
15             do
16             {
17                 coins += 10;
18             } while (coins < 100);
19             lblCoins.Text = "Coins: " + coins;
20         }
21     }
22 }
23
24
```

**Windows Form (Form1):**

The form has a title bar with 'For...' and standard window controls. The main area contains the text 'COIN COLLECTOR', a label 'Coins: 100', and a button labeled 'COLLECT'.
